

Fortify on Demand

Test and Score Software Security Risks Accurately

IT security teams often struggle with the challenge of managing application security risk across their entire software portfolio. The breadth of in-house, vendor, outsourced, and open source packages utilized in today's enterprise demands a more proactive and regularly scheduled testing regimen.

Fortify on Demand is a set of hosted Security-as-a-Service (SaaS) solutions that allow any organization to test and score the security of all their software – quickly and affordably. This automated turnkey offering returns the most accurate and complete analysis of security vulnerabilities available on the market.

Fortify on Demand delivers the following benefits:

- Improved understanding, prioritization of software risk
- Promotion of secure coding practices earlier in development
- Empowerment of developers to help manage vulnerabilities
- Scaling limited security resources at reduced cost
- Integration with Fortify® 360, for easy upgrade

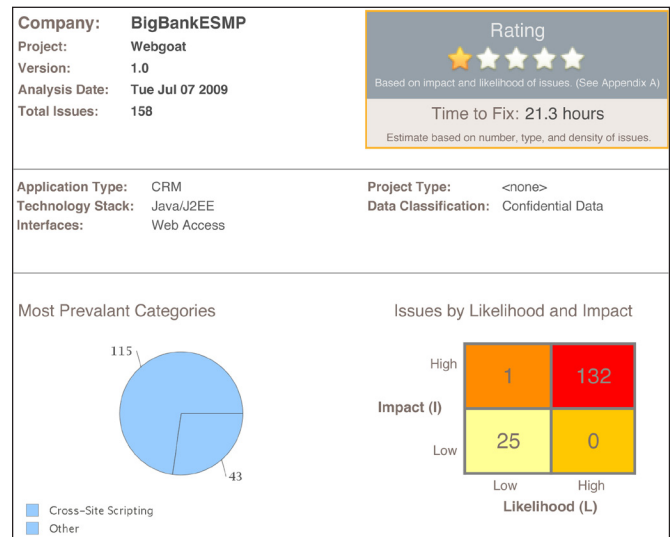

Automated, Accurate Vulnerability Assessment

Fortify on Demand provides both source and binary level static analysis for accurate detection of security vulnerabilities in either in-house or third-party applications. Secure coding practices aim to expose risks earlier in the software development life cycle, when they are cheaper and easier to address. Fortify on Demand is simply more accurate and scalable than comparably more expensive assessment services.

Developers Test & Score Their Own Software

Users simply upload either the source code or compiled version of their application and Fortify does the rest. It completes award-winning analysis of Java, .NET or PHP applications – detecting more than 60 vulnerability categories. The assessment is delivered in a comprehensive vulnerability report featuring a consistent five-star star rating

system for easy prioritization. These reports include line of code level details based on severity and exploitability with suggestions on how to fix each problem.

Reports return deep analysis of security vulnerabilities

“The single biggest step for businesses to reduce risk today is to force major improvements in poorly designed and insecure software and applications.”

— John Pescatore, Senior Analyst, Gartner

Self-Service Software Security Testing with Control

Empower both internal and external developers to take a more active role in promoting secure code production by testing and scoring more frequently. Teams can rely on Fortify *on Demand's* highly secure SaaS environment when loading code and reporting back to all stakeholders. Take a more proactive approach to software security assessment offering increased visibility into high priority vulnerabilities.

Fortify Vendor Security Management

Fortify *on Demand* Vendor Security Management (VSM) enables any third-party development team – vendor, open source or outsourcers – to test and score the security of their applications themselves, then publish a report back to the VSM customer. By never having to share their source code, Fortify *on Demand* VSM compels vendors to take action to proactively fix vulnerabilities by allowing them to remain in control of the process.

Security professionals can demand that high priority problems be addressed and verified during the procurement or upgrade process, prior to acceptance. Fortify VSM serves as an independent third party and system of record for conducting a consistent, unbiased analysis of the application and providing a detailed tamper-proof report back to the security team.

Fortify Enterprise Assessment Management

Fortify *on Demand* Enterprise Assessment Management (EAM) enables any internal development team to test and score the security of its in-house software. Promoting self-

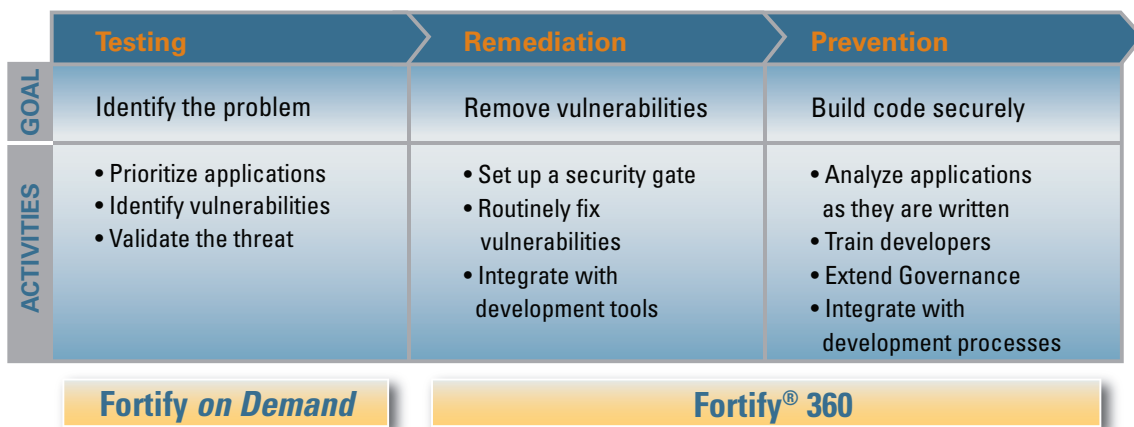

service encourages large, often distributed teams to test more frequently. They can efficiently and effectively produce summary and detailed reports on the project state so the Security Team remains informed.

The cost of scaling regular software security assessments has remained prohibitive using traditional approaches. Pay as you go assessment services lead to development teams engaging them as infrequently as they can justify. Internal assessments often lack the necessary expertise to catch and remediate all critical vulnerabilities.

In contrast, Fortify EAM users enjoy unlimited uploads and scans with expert remediation options available. Developers take responsibility for consistently remediating their own software without disruption to the development process.

Upgrade Easily to Fortify 360

Best of all, Fortify *on Demand* uses the same award-winning analysis technology as Fortify 360, making it easy for customers to graduate from hosted testing to high-throughput vulnerability remediation and prevention as part of a robust Software Security Assurance program.
